Partial Order Relation - Part II

Foundation Course on Discrete Mathematics for GATE

Sanchit Jain • Lesson 9 • Feb 14, 2022

Cartesian Product

1. Cartesian Product of two sets A and B in the set of all ordered pairs, whose first member belongs to the first set and second member belongs to the second set, denoted by $A \times B$.

2. For E.g. if $A = \{a, b\}$, $B = \{1, 2, 3\}$

3. $A \times B = \{$ $\}$

- It is a kind of maximum relation possible, where every member of the first set belong to every member of the second set.

- $A \times B = \{(a, b) \mid a \in A \text{ and } b \in B\}$

Use Referral Code KGYT for Unacademy Plus(Live) to Get maximum Discount

1. In general, commutative law does not hold good $A\times B \mathrel{!=} B\times A$

2. If $|A| = m$ and $|B| = n$ then $|A\times B| =$

Q The number of binary relations on a set with n elements is: **(GATE-1999) (1 Marks)**

(A) n^2

(B) 2^n

(C) 2^{n^2}

(D) None of the above

Use Referral Code KGYT for Unacademy Plus(Live) to Get maximum Discount

Q Let A be a finite set of size n. The number of elements in the power set of A × A is: **(GATE-1993) (1 Marks)**

a) $2^{(2^n)}$

b) $2^{(n^2)}$

c) 2^n

d) None of the above

Relation

- **Relation**: - Let A and B are sets then every possible subset of 'A×B' is called a relation from A to B.

- If |A| =m and |B| = n then total no of element(pair) will be m*n, every element will have two choice weather to present or not present in the subset(relation), therefore the total number of relation possible is _____

- **<u>Partial Order Relation</u>**: - A relation R on a set A with cartesian product A×A is said to be partial order, if it is

1. **Reflexive**
2. **Anti - Symmetric**
3. **Transitive**

Use Referral Code KGYT for Unacademy Plus(Live) to Get maximum Discount

1. In mathematics, especially order theory, a **partially ordered set** (also **poset**) formalizes and generalizes the intuitive concept of an ordering, sequencing, or arrangement of the elements of a set.

2. A poset consists of a set together with a binary relation indicating that, for certain pairs of elements in the set, one of the elements precedes the other in the ordering.

3. The relation itself is called a "partial order." The word *partial* in the names "partial order" and "partially ordered set" is used as an indication that not every pair of elements needs to be comparable.

4. That is, there may be pairs of elements for which neither element precedes the other in the poset. Partial orders thus generalize total orders, in which every pair is comparable.

Use Referral Code KGYT for Unacademy Plus(Live) to Get maximum Discount

- **<u>Partial ordering set (Poset):</u>** - a set A with partial ordering relation R defined on A is called a POSET and is denoted by [A, R]

Q.19 A relation R is said to be circular if aRb and bRc together imply cRa. Which of the following options is/are correct?

(Gate-2021) (1 Marks)

(a) If a relation S is reflexive and circular, then S is an equivalence relation.

(b) If a relation S is circular and symmetric, then S is an equivalence relation.

(c) If a relation S is transitive and circular, then S is an equivalence relation.

(d) If a relation S is reflexive and symmetric, then S is an equivalence relation.

Conversion of POSET into a Hasse Diagram

- If we want to study Partial order relation further then it will be better to convert it into more convenient notation so that it can be studied easily.

- This graphical representation is called Hasse Diagram

- In order theory, a Hasse diagram is a type of mathematical diagram used to represent a finite partially ordered set, in the form of a drawing of its transitive reduction.

- The diagrams are named after Helmut Hasse (1898–1979)

Steps to convert partial order relation into hasse diagram

1- Draw a vertex for each element in the Set

2- If (a, b) ϵ R then draw an edge from a to b

3- Remove all Reflexive and Transitive edges

4- Remove the direction of edges and arrange them in the increasing order of heights.

Q Consider a Partial order relation and convert it into hasse diagram?

R = {(1,1), (1,2), (1,4), (1,8), (2,2), (2,4), (2,8), (4,4), (4,8), (8,8)}

$I \propto \frac{1}{P}$

Q Consider a Partial order relation and convert it into hasse diagram?

R = {(1,1), (1,2), (1,3), (1,6), (2,2), (2,6), (3,3), (3,6), (6,6)}
