Proposition - Part II

Foundation Course on Discrete Mathematics for GATE

Sanchit Jain • Lesson 11 • Feb 17, 2022

Conversion of POSET into a Hasse Diagram

- If we want to study Partial order relation further then it will be better to convert it into more convenient notation so that it can be studied easily.

- This graphical representation is called Hasse Diagram

- In order theory, a Hasse diagram is a type of mathematical diagram used to represent a finite partially ordered set, in the form of a drawing of its transitive reduction.

- The diagrams are named after Helmut Hasse (1898–1979)

Steps to convert partial order relation into hasse diagram

1- Draw a vertex for each element in the Set

2- If (a, b) ϵ R then draw an edge from a to b

3- Remove all Reflexive and Transitive edges

4- Remove the direction of edges and arrange them in the increasing order of heights.

Q Consider a Partial order relation and convert it into hasse diagram?

R = {(1,1), (1,2), (1,4), (1,8), (2,2), (2,4), (2,8), (4,4), (4,8), (8,8)}

Q Consider a Partial order relation and convert it into hasse diagram?

R = {(1,1), (1,2), (1,3), (1,6), (2,2), (2,6), (3,3), (3,6), (6,6)}

1. Proposition with rules of logic actually is a method of reasoning (unambiguous, machinic, deterministic), given by Aristotle, who was the teacher of Alexander son of King Philip of Macedonia

2. There may be different methods of reasoning for solving a problem apart from proposition.

Use Referral Code KGYT for Unacademy Plus to Get minimum 10% Discount

1. Proposition and rules of logic specify the meaning of mathematical statements. Logic is the basis of all mathematical reasoning, and of all automated reasoning.

2. It has practical applications to the design of computing machines, to the specification of systems, to artificial intelligence, to computer programming, to programming languages, and to other areas of computer science, as well as to many other fields of study.

Use Referral Code KGYT for Unacademy Plus to Get minimum 10% Discount

1. To understand mathematics, we must understand what makes up a correct mathematical argument, that is, a proof.

2. Once we prove a mathematical statement is true, we call it a theorem. A collection of theorems on a topic organize what we know about this topic.

Use Referral Code KGYT for Unacademy Plus to Get minimum 10% Discount

1. Everyone knows that proofs are important throughout mathematics, even in computer science. In fact, proofs are used to verify that computer programs produce the correct output for all possible input values, to show that algorithms always produce the correct result.

2. The rules of logic give precise meaning to mathematical statements. These rules are used to distinguish between valid and invalid mathematical arguments.

Use Referral Code KGYT for Unacademy Plus to Get minimum 10% Discount

1. The area of logic that deals with propositions is called the **propositional calculus** or **propositional logic or predicate calculus(study of propositions)**.

2. It was first developed systematically by the Greek philosopher Aristotle more than 2300 years ago.

3. We now turn our attention to methods for producing new propositions from those that we already have. These methods were discussed by the English mathematician George Boole in 1854 in his book *The Laws of Thought*.

Types of proposition

1. We use letters to denote **propositional variables** (or **statement variables**), that is, variables that represent propositions, just as letters are used to denote numerical variables.

2. The conventional letters used for propositional variables are *p, q, r, s*. The **truth value** of a proposition is true, denoted by T, if it is a true proposition, and the truth value of a proposition is false, denoted by F, if it is a false proposition.

Use Referral Code KGYT for Unacademy Plus to Get minimum 10% Discount

- Many mathematical statements are constructed by combining one or more propositions. New propositions, called **compound propositions**, are formed from existing propositions using logical operators.

Use Referral Code KGYT for Unacademy Plus to Get minimum 10% Discount

Operators / Connectives

1. **Negation:** - let p be a proposition, then negation of p new proposition, denoted by ¬*p*, is the statement "it is not the case that p".

2. The truth value of the negation of *p*, ¬*p*, is the opposite of the truth value of p. e.g. ¬"Michael's PC runs Linux" = "It is not the case that Michael's PC runs Linux." = "Michael's PC does not run Linux."

Bi-conditional

- Let p and q be propositions. The bi*conditional statement* $p \leftrightarrow q$ is the proposition.
  - " *p if and only* q".

- The biconditional statement $p \leftrightarrow q$ *is true when p and q have the same values, and false otherwise. Biconditional statements are also called bi-implications.*
  - "p is necessary and sufficient for q"
  - "if p then q, and conversely"
  - "p iff q."
  - $p \leftrightarrow q = (p \rightarrow q) \wedge (q \rightarrow p)$

Q.17 Let p and q be two propositions. Consider the following two formulae in prepositional logic.

(Gate-2021) (1 Marks)

$S_1 : (\neg p \wedge (p \vee q)) \rightarrow p$

$S_2 : q \rightarrow (\neg p \wedge (p \vee q))$

Which one of the following choices is correct?

(a) Neither S_1 nor S_2 is a tautology.

(b) Both S_1 and S_2 are tautologies.

(c) S_1 is a tautology but S_2 is not a tautology.

(d) S_1 is not a tautology but S_2 is a tautology.

Q.50 Choose the correct choice(s) regarding the following propositional logic assertion S: **(GATE- 2021)**

$$S : ((P \wedge Q) \rightarrow R) \rightarrow ((P \wedge Q) \rightarrow (Q \rightarrow R))$$

(a) S is a tautology.

(b) S is neither a tautology nor a contradiction.

(c) The antecedent of S is logically equivalent to the consequent of S.

(d) S is a contradiction.
